Snap N' Learn: Feature Planning

Paul Viramontez IV | Co-op Ed | Module 3 | November 12, 2026

The app description recommends keeping Version 1 focused on three core functions: taking pictures of questions, typing questions, and delivering easy-to-understand explanations. The lists below follow that guidance, with two additions to Version 1: Follow-Up Questions and Saved Answers and Study Guides.

Version 1 Features

1. **Snap a Question.** This is the app's signature feature and the reason for its name. It sets Snap N' Learn apart from a basic chatbot, so users need it from day one.
2. **AI Question Assistant (typed questions).** Typing is the simplest way to ask a question, and it works as a backup when a photo isn't practical. It also covers the app's core promise: ask anything and get a quick answer.
3. **Step-by-Step Explanations.** This is what separates the app from a search engine or answer key. The main goal is helping users *understand* rather than memorize, so explanations should be built into the answers from the start. Because this is the format of the AI's response, it doesn't need to be a separate, complicated feature to build.
4. **Follow-Up Questions.** One answer rarely covers everything a learner wants to know. Letting users ask more questions about an explanation, without starting over, supports the app's goal of encouraging curiosity and deeper understanding. It requires the app to remember the conversation, so it is the more complex of the Version 1 features.
5. **Saved Answers and Study Guides.** Saving explanations gives users a reason to come back and turns the app from a one-time answer tool into a study resource. For Version 1, this can stay simple: save an explanation and view it later, with folders and organized study guides added in a later update.

Future Update Features

From the Future Vision list

6. **Voice Questions.** This is a convenience feature. Typing and photos already give users two ways to ask, so voice adds the least new value early on while requiring extra technology.
7. **Multiple Languages.** Translating explanations accurately takes careful testing. It's best to get the English version working well first, then expand to a wider audience.
8. **AI Flashcards.** This builds directly on Saved Answers, so it can't happen until saving exists. It's a natural next step after that feature is in place.
9. **Practice Quizzes.** Like flashcards, quizzes work best once users have saved topics to study. They would also need extra work to make sure the questions are accurate and useful.
10. **Personalized Learning.** The app needs to track a user's activity over time before it can tell which subjects they struggle with. That requires accounts, stored data, and usage history, so it only makes sense after the app has users.
11. **AI Study Planner.** This moves the app beyond answering questions into organizing schoolwork, which is nearly a separate product. It's best added once the core learning experience is proven.

Suggested Update Order

Update	Features	Why this order
Version 1	Snap a Question, Typed Questions, Step-by-Step Explanations, Follow-Up Questions, Saved Answers and Study Guides	Delivers the core promise and gives users a reason to keep learning and return
Version 2	AI Flashcards, Practice Quizzes	Builds on saved content
Later	Voice, Multiple Languages, Personalized Learning, AI Study Planner	Expands the audience and turns the app into a full learning platform

A note on scope: Version 1 now has five features instead of the three in the original recommendation, so it is a larger first build. If time runs short, Follow-Up Questions and Saved Answers and Study Guides are the first to move back to a later update.

Each feature in version 1 is important because they all set up the foundation for new revisions in case errors were made or something new is needed to be added
